TIMELINE OF AI EVOLUTION

1950
ALAN TURING PROPOSES THE TURING TEST

Alan Turing introduced the idea of testing whether a machine could imitate human intelligence through conversation.This is one of early foundations of Artificial Intelligence.

1951
SNARC : Early Neural N
Machine

Marvin Minsky and Dean Edmonds built SNARC, one of the earliest neural-network machines.It showed earliest onset of brain inspired computing.

1956
Dartmouth Conference:
Birth of AI

The Dartmouth Conference is considered the official birth of artificial intelligence as a field.This was the event which started the AI as a formal research area.

1957 - 1959
General Problem
Solver

Allen Newell, Herbert Simon, and J.C Shaw developed the General Problem Solver.It was one of the first AI Programs designed to imitate human-like problem-solving.

1958
Frank Rosenblatt's
Perceptron

Frank Rosenblatt developed the Perceptron , an early artificial neural network that could learn simple patterns. It became an important foundation for later neural networks and deep learning.

1966
ELIZA : Early Chatbot

Joseph Weizenbaum created ELIZA, one of the first chatbot programs.It stimulated conversation and became early onset of natural language processing.

1969
Criticism of Early
Neural Networks

Marvin Minsky and Seymour Papert published Perceptrons, which highlighted limitations of early neural networks. The reduced enthusiasm for neural network research and helped lead towards first AI winter.

1972 - 1976
MYCIN Expert System

MYCIN was developed at Stanford to help diagnose bacterial infections and recommend antibiotics. It showed that the AI could support expert decision-making in medicine.

1974 - 1980

FIRST AI WINTER

AI funding and interest declined because early systems failed to meet high expectations.Limited computing power, lack of data , and unrealistic predictions slowed progress.

1980s

Expert Systems become commercial

Expert Systems became popular in business, medicine, finance , and engineering. They proved AI could have commercial value, but they were expensive and difficult to maintain.

1986

Backpropagation Revives Neural Networks

David Rumelhart, Geoffrey Hinton, and Ronald Williams popularized backpropagation.This helped multi-layer neural networks learn more effectively and later became essential to deep learning.

1987 - 1993

SECOND AI WINTER

AI entered another downturn after expert systems became costly and hard to maintain. The collapse of the Lisp machine market also reduced to business confidence in AI.

1997

IBM Deep Blue Defeats Garry Kasparov

IBM's Deep Blue defeated world chess champion Garry Kasparov in a six-game match.It showed that AI could outperform humans in computer strategy games.

2002

Roomba brings AI Robotics Home

iRobot introduced Roomba, an autonomous robotic vacuum cleaner. It helped bring AI-powered robotics into everyday household life.

2006

Deep Learning Revival Begins

Deep Learning gained momentum as better algorithms, larger datasets, and stronger computing power become available. This helped restart major progress in neural-network research

2009

ImageNet Accelerates Computer Vision

ImageNet provided a massive labeled training and testing AI models.It became one of the key resources behind later computer vision breakthroughs.

2011

IBM Watson Wins Jeopardy

IBM Watson defeated a former Jeopardy champions Ken Jennings and Brad Rutter.This was a major achievement in natural language processing and questions answering.

2011

SIRI Makes AI Voice Assistants Mainstream

Apple introduced Siri on the iphone , bringing voice-based AI assistance to millions of users.This helped makes AI part of everyday consumer technology.

2012

AlexNet wins ImageNet

AlexNet used deep convolutional neural networks and GPUs to achieve a major improvement in image recognition. This breakthrough helped launch the modern deep learning boom.

2014

GANs Advance Generative AI

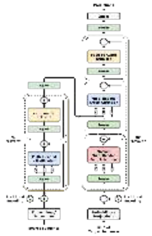
Generative Adversarial Networks allowed AI systems to generate realistic Images and synthetic media. This became an important step toward modern generative AI.

2016

AlphaGo Defeats Lee Sedol

Google Deepmind's AlphaGo defeated world Go champion Lee Sedol.This was important because Go is highly complex and required advanced deep thinking and reinforcement learning.

2017



Transformer Architecture Introduced

Google researchers introduced the Transformer architecture in Attention is All You Need. Transformers became the foundation for modern large language models.

2018

BERT Improves Language Understanding

Google introduced BERT, a transformer-based model for natural language understanding. It improved search, question answering, and many other language AI tasks.

2020

GPT-3 shows the Power of Large Language Models

OpenAI released GPT-3, showing that very large language models could generate human-like text and perform many language tasks. It became a major step towards modern generative AI.

2020

RAG connects AI with External Knowledge

Retrieval-Augumented Generation, or RAG, combined language models with external information retrieval. This made AI more useful for search, enterprise knowledge systems , and factual questions answering.

2021

AlphaFold Transforms Biology

DeepMind’s AlphaFold made major progress in predicting protein structures.This showed how AI could accelerate biology, medicine, and drug discovery.

2022

Text-to-Image AI becomes Mainstream

Tools such as DALL-E 2 and Stable Diffusion showed that AI could generate images from text prompts.This changed digital art, design, media and copyright discussions.

2022

ChatGPT brings Generative AI to the Public

OpenAI released ChatGPT, making generative AI widely accessible through a conversational interface.It changed how people use AI in education, business, writing, coding, and research.

2023

Claude, LLaMA, and AI Agents expand the AI ecosystem

Claude showed the rise of safety-focused AI assistants, while LLaMA expanded the Open Source language models.AI agents also became popular as systems that could use tools and attempt multi-step tasks.

2024

EU AI Act and MCP Shape the Future of AI

The EU AI Act showed the that governments were beginning to regulate the AI.MCP showed the growing need for AI systems to connect safely with tools, files, databases and business systems.
